1. Project Infrastructure

Current site infrastructure at Oconnor-Wilkins supports a processing capacity of 1 Mtpa.
Power requirements are met through a combination of grid and onsite LNG generation.

2. Metallurgical Testwork

Recoveries for Coal are modeled at 91.7%.
Testwork was performed at Hunt PLC laboratories using representative composite samples.

3. Mine Design and Scheduling

The mine plan utilizes a block caving sequence.

Waste rock characterization indicates low potential for acid mine drainage.
